One computer on your desk isn't enough? do you require the amount of security provided with nothing but a new operating system? if the answer to any of the above is yes, here's a solution!this part is not difficult ... find an appropriate case for the deployment of the following components; 4 port USB hub 1–2 USB flash drives male to female USB cable – not essential. when choosing (or creating) a case there are 2 things to consider, these are; Material - metal can short bare electrical components plastics - are easy to operate with 2 unused USB hub ports can be used for memory or user interface devices such as mouse or keyboard, so it's a good idea to keep these affordable. the case should contain only 2 parts of schemes, 4 port hubs and at least 1 USB flash drive (1GB or higher), you may need to remove the plastic hub housing and memory in order to fit! Connect it as the photo shows and insert it into your case!depending on the space of your chosen thumb you will need to choose an operating system. I recommend Damn Small Linux (DSL) for discs up to 4 GB and Ubuntu for devices of 4 GB or more. Connections: Lucid puppy (dsl build) 20Latest%20Release.htm Ubuntu... - download recommended version! Just burn the selected ISO on a thumb drive using the program of your choice! Bios before this OS will boot is important to rearrange the boot order of the computer you want to use the device with. enters the BIOS using the default boot key (depends on the machine version and BIOS) and ensure usb is in the first bootable slot.at this time in time you have three available USB ports of hub, they can be used for; Mice keyboards Linux compatible usb Dongle / Wi-Fi antenna extra space for files in the form of thumb discs or external hard drives the possibilities are really endless, so be creative! PDF of these steps... s it! Participated in the USB contest by the ExtremeTech team on May 17, 2001 at 12:00 PM This site may earn affiliate commissions from the links on this page. Terms of Use. PC Guide has some good guides and sometimes satisfies articles, but generally misses its mark. The news is standard and not too detailed; discussion forums seem to and the Council of the Day and the associated archive were not particularly illuminated. Perhaps the most non-obese stuff about the site is too many flashing images and banner ads on most pages. However, drivers provide a good primer on several hardware themes. Hello everyone, I was looking into buying cod world in war for old zombie cards for pc. I know there are many ways to use a computer controller, but I really do not know how... Can I use the Xbox controller to play... any idea? thanks =) Likes or not, the PC will become more like a tablet. I'm not just talking about form factor or whether they have touch screens; I'm talking about the way you interact with your computer. And that's nice. But for some of us, depending on how things were shaking, it could also be a bad thing. About a year ago- on the eve of the introduction of the iPad to be accurate - I wrote why the tablets really weren't caught. I researched various reasons to explain why there are displaced in niche status - kludgy hardware, not killer app, the added cost of buying a PC tablet over a regular laptop. But the biggest setback for me has always been software. Windows tablets run a mouse-controlled user interface on a touch device. The end result is something that is cumbersome at best, and downright unusable at worst. The same can be said of touch-inspired interfaces on a desktop or laptop. (Note: I use the term PC to mean any desktop or laptop running an operating system with a mouse. Before we jump into this, let's be honest; there are tricks on the computer can be learned from the tablet. OSes created specifically for tablets are significantly lighter than desktop OSes, which typically occupy several gigabytes of disk space. Tablet OSes also represent a kind of clean break from traditional desktop OSes, so they don't carry as much digital baggage. From the hardware there are certain areas where computers can learn from tablets. Imagine if you want a compact, ultra-lightweight Windows 8 laptop built around a chip system instead of a traditional PC processor and motherboard. This would be light, reasonably powerful (or at least powerful enough for most tasks) and would have SSD storage and long battery life. Think of it as an evolution of netbook/ultraportaruema, but with the gut of the tablet. But while it makes sense to introduce tablet components to PCs, the software side may be a little more hooked. There is a company that has started pushing the idea of a desktop operating system with elements of tablet--Apple. At Apple's last major media event, give a short demo version of Lion, the next big mac OS X release. Full screen modes for applications. A new iOS-inspired app starter called Launchpad. Even app store for Mac software. Yes, I haven't got my hands on it yet, but my initial impression of Lion's new iPad-iesque features is that many of them just seemed narrow-minded. Owning a Mac laptop and an emerging trend in the OS X universe is applications that mimic the appearance, feel and functionality of iPad applications. One of the latest examples in Apple's universe is Reeder for Mac, an RSS reader currently under development and currently in public beta. This is one weakening Reeder's version of the iPad and takes various design subprojects from the iPad app. But as programmer Daniel Kennett notes, building an app with a touch in the mind first and mouse second can cause some problems. In reeder's case, there are very few pads around the buttons and switches to the interface - no title for the app, for example - and some of the controls are relatively small, which can make them hard to hit, say, a 21-inch iMac screen. Daniel's article slipped into some nerderly design user interface, but it has some good graphics to illustrate his point of view, and it's worth giving read. 10000000000000000000 As Daniel put it:Just for fun, I opened an iPad Simulator and moved reeder for mac above it Remove widgets for Mac OS X windows, and this can be a screenshot of an app on your native iPad. It's not how to make Mac apps, guys. In other words, just because something works on a touchscreen doesn't necessarily mean they'll translate well on the desktop. Another prominent example is iPhoto 11, the latest version of Apple's photo management software, which also occupies many of the iPads. This is the template you see if you decide to make a book out of some of your photos: This screen looks a lot like something out of an iPad app and works a lot like something out of an iPad app - so much so that you might be tempted to reach out and try to slide your finger with your finger. But I found that this panel is significantly more annoying to work with than, the list of templates you would find in previous versions of iPhoto: These are the kinds of problems that OS developers and providers will face going forward. While I expect tablets to have some impact on future versions of Windows and Mac OS X, Microsoft and Apple need to be careful to make sure these new additions don't drive bats users for a long time. At D: All Things Digital Conference last summer, Steve Jobs had this to say about the future of PC (as reported by our cohorts at Macworld): PCs will be like trucks. Fewer people will need them... This transformation will make some people resist. The computer took a long way. I own an iPad and a laptop. My iPad is great for things like reading and browsing the internet. It is also usable for shooting fast e-mail and can be used for some content creation (photo editing, for example). But I'm a writer and editor by profession. I work regularly in spreadsheets in Excel. I've got to get some. the snad. Keyboard. I should be able to see multiple windows on the screen. I don't want to have multitasking restrictions. I need a truck. Computers won't disappear. The windows don't go away. Mac OS X does not disappear. Computers may not be the first choice for most users in ten years, and they may take a slightly different form, but the computer is here to stay. Nick Mediatl can not imagine eavesdropping on this blog post on iPhone.Get your GeekTech on: Twitter - Facebook - RSS | Note: When you purchase something after clicking on links in our articles, we may receive a small commission.
